

LACROSSE STICK WITH REPLACEABLE MODULAR HANDLE SECTION

Abstract

A lacrosse stick with replaceable modular handle sections includes a sectional handle, an interlocking mechanism for the sectional handle, and a head. The sectional handle includes an upper elongate section having both a top end and a locking bottom end and a lower elongate section having both a locking top end and a bottom end. The interlocking mechanism serves to interlock the locking bottom end of the upper elongate section with the locking top end of the lower elongate section. The head is mounted on the top end of the upper elongate section and includes both a closed-loop frame and a net suspended substantially within the confines of the frame. The interlocking mechanism can be unlocked so that either the upper elongate section or the lower elongate section of the sectional handle may be replaced as desired in a modular fashion with a substitutive elongate section.
